

What is abstraction and why is it important?

Abstraction is a way to hide unnecessary details of a program. This is a great way of increasing the readability of code, especially for non-authors. Having the code split up like this also helps prevent mistakes and helps the programmer to focus in on what he or she really needs to do or improve. While a program class might not have all the details about how a journal is displayed with `'journal.Display();'`, it doesn't need to because that is all handled in the `'Journal.cs'` class.
